Appendix B: Provincial Case Definitions for Diseases of Public Health Significance

Disease: Group B Streptococcal disease, neonatal

Effective: February 2019
Group B Streptococcal disease, neonatal

1.0 Provincial Reporting
Confirmed and probable cases of disease

2.0 Type of Surveillance
Case-by-case

3.0 Case Classification

3.1 Confirmed Case
Laboratory confirmation of Group B Streptococcus (Streptococcus agalactiae) from a normally sterile site in a newborn (e.g., cerebrospinal fluid [CSF]), with clinically compatible signs and symptoms of invasive disease in a newborn up to 28 days after birth.

3.2 Probable Case
Clinically compatible signs and symptoms with a clinical diagnosis of invasive Group B Streptococcal disease in a newborn up to 28 days after birth, whose mother has laboratory confirmation of Group B Streptococcus (Streptococcus agalactiae) from a lower vaginal or anorectal specimen or from a normally sterile site (e.g., blood); OR
Clinically compatible signs and symptoms with a clinical diagnosis of invasive Group B Streptococcal disease in a newborn up to 28 days after birth and laboratory confirmation of Group B Streptococcus (Streptococcus agalactiae) isolated from the placenta or amniotic fluid.

4.0 Laboratory Evidence

4.1 Laboratory Confirmation
Any of the following will constitute a confirmed case of Group B Streptococcal Disease of the newborn:
- Positive Group B Streptococcus (Streptococcus agalactiae) culture from a normally sterile site (e.g., CSF, blood, pleural or joint fluid) in infants
- Positive nucleic acid amplification test (NAAT) for Group B Streptococcus from a normally sterile site in infants

4.2 Approved/Validated Tests
- Standard culture for Group B Streptococcus with serogrouping
- NAAT for Group B Streptococcus
4.3 Indications and Limitations

Not applicable

5.0 Clinical Evidence

Clinically compatible signs and symptoms are characterized by the following:
- Early onset disease (<7 days), characterized by sepsis, pneumonia, and less frequently meningitis, osteomyelitis or septic arthritis
  OR
- Late onset disease (≥7 days to 1 month), characterized by sepsis and meningitis.

6.0 ICD 10 Code(s)

P36.0 Sepsis of newborn due to streptococcus, group B

7.0 Comments

Probable cases are included to ensure completeness of reporting in cases where an infant is treated early with antibiotics before all the appropriate specimens have been taken. It is expected that virtually all cases will be reported from hospitals.
