Appendix B: Provincial Case Definitions for Reportable Diseases

Disease: Psittacosis/Ornithosis

Revised December 2014
Psittacosis/Ornithosis

1.0 Provincial Reporting

Confirmed and probable cases of disease

2.0 Type of Surveillance

Case-by-case

3.0 Case Classification

3.1 Confirmed Case

Laboratory confirmation of infection with clinically compatible signs and symptoms:

- A significant (i.e., fourfold or greater) rise in antibodies to *Chlamydophila* (formerly *Chlamydia*) *psittaci*
  
  OR

- Isolation of the infectious agent from a clinical specimen (e.g., blood, sputum)
  
  OR

- Positive for nucleic acid amplification testing (NAAT) for *C. psittaci* specific targets

3.2 Probable Case

Clinically compatible signs and symptoms in a person with:

- An epidemiologic link to a known source (i.e., human, animal or environment)
  
  OR

- Supportive serology (e.g., *C. psittaci* titre of ≥ 32) with one or more serum specimens obtained after onset of symptoms

4.0 Laboratory Evidence

4.1 Laboratory Confirmation

Any of the following will constitute a confirmed case of psittacosis/ornithosis:

- Isolation of infectious agent from clinical specimen [This should be done in a Containment level 3 facility, being a risk level 3 agent in Canada.]

- A significant (i.e., fourfold or greater) rise in antibody response towards *C. psittaci* with specimen collection ≥ 2-3 weeks apart.

- Positive for nucleic acid amplification testing (NAAT) for *C. psittaci* specific targets
4.2 Approved/Validated Tests

- Microimmunofluorescence (MIF) assay for serologic response to *C. psittaci*, with positive and negative control sera used with each run and other quality indices as described by Dowell et al.
- NAAT for *C. psittaci* specific targets

4.3 Indications and Limitations

- Chronic *C. psittaci* human infection has been found to be associated with ocular adnexal mucosa-associated lymphoid tissue [MALT]-type lymphoma in some instances
- A commercial kit for MIF testing (Cypress Ca) contains antigens for *C. pneumoniae*, *C. psittaci* and *C. trachomatis*. However, cross reactivity among closely related agents using MIF test procedures have been observed; the sensitivity and specificity of the MIF for diagnosis of psittacosis specifically is not well evaluated and so interpretation of titre must be linked with symptoms and / or linkage with definitive cases (see also recent publication by Verminnen et al.).
- In-house NAAT testing should be done using standard controls

5.0 Clinical Evidence

Mild forms may be mistaken for common respiratory illnesses. The disease can have a sudden onset with fever, chills, sweating, myalgia, loss of appetite and headaches. Human disease can be severe, especially in untreated elderly persons.

6.0 ICD Code(s)

ICD 10 Code A70

7.0 Comments

N/A
