Ministry of Health

Administration of Moderna COVID-19 Vaccine

Version 3.0 – June 18, 2021

Highlights of changes

- Link to COVID-19 Vaccine Series Second Dose Eligibility Quick Reference (Page 3)
- Clarified sources of Polyethylene Glycol (Page 6)
- Side Effects Section updated to include international reports of pericarditis/myocarditis (Page 8)
- Link to Public Health Ontario resource on the Management of Anaphylaxis Following Immunization in the Community (Page 9)
- Updated guidance on AEFI reporting (Page 9)
- Updated Point of Care Guidance for alternate vaccine product (Page 10)
- Updated to align with Vaccine Administration changes in the product monograph (Pages 4, 11-12)

This guidance provides basic information only. This document is not intended to provide or take the place of medical advice, diagnosis or treatment or legal advice.

In the event of any conflict between this guidance document and any applicable emergency orders, or directives issued by the Minister of Health, Minister of Long-Term Care, or the Chief Medical Officer of Health (CMOH), the order or directive prevails.

- Please check the Ministry of Health (MOH) COVID-19 website regularly for updates to this document.
What is COVID-19?

COVID-19 is a novel coronavirus disease 2019 that is caused by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2).

Anyone can be infected with SARS-CoV-2 (COVID-19). However, some populations are at increased risk of exposure to the virus (e.g., due to living or work settings), and some populations are at increased risk of severe disease and death due to biological (e.g., advanced age, pre-existing medical conditions) and social (e.g., low socioeconomic status, belonging to a racialized population) factors.

Additional information about the Moderna COVID-19 Vaccine can be found in the product monograph.

General Clinic Precautions

All staff working in the clinic must take appropriate infection prevention and control measures, including donning appropriate personal protective equipment (PPE) when interacting with clients as they move through the immunization clinic and when responding to any adverse events following immunization (AEFI).

The Vaccine

<table>

<thead>
<tr>
<th>Schedule</th>
<th>2 doses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum interval¹</td>
<td>21 days</td>
</tr>
<tr>
<td>Authorized Interval²</td>
<td>28 days</td>
</tr>
<tr>
<td>Recommended interval</td>
<td>4 months*</td>
</tr>
</tbody>
</table>

To increase the number of individuals benefiting from the first dose of vaccine, the province is following recommendations from the National Advisory Committee on Immunization (NACI) to extend the second dose of COVID-19 vaccine up to **4 months** after receipt of the first dose.

 Certain population groups exempt from the extended dose interval are described here: COVID-19 Vaccine Series Second Dose Eligibility Quick Reference.

Booster doses

At present there is no evidence for an additional booster after the 2-dose series

Route of administration

Intramuscular (IM) injection into the deltoid muscle

Nature of the antigen

Prefusion spike (S) protein

Adjuvant (if present)

None

## Storage requirements

<table>
<thead>
<tr>
<th>Frozen vials prior to use</th>
<th>Should be stored at temperatures of -25°C to -15°C and protected from light, in the original packaging. Do not store on dry ice or below -40°C.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thawed, unpunctured vials</td>
<td>If not punctured, the Moderna COVID-19 vaccine should be thawed and stored at +2°C to +8°C for up to 30 days, or at +8°C to +25°C for up to 24 hours. During storage, vials should be protected from light, in the original packaging. Do not refreeze thawed vials.</td>
</tr>
<tr>
<td>Thawed, punctured vials</td>
<td>The Moderna COVID-19 vaccine should be stored between +2°C to +25°C and used within 24 hours from the time of first puncture. During storage, vials should be protected from light.</td>
</tr>
<tr>
<td>Formats available</td>
<td>Multi-dose vial (10 doses*), preservative-free *Canada may receive product that is labelled for the US market. Please read the vial label closely prior to administration to determine the number of doses available per vial.</td>
</tr>
<tr>
<td>Usage limit</td>
<td>24 hours at +2°C to +25°C</td>
</tr>
<tr>
<td>Drug Interactions</td>
<td>No interaction studies have been performed.</td>
</tr>
</tbody>
</table>

Evidence on vaccine effectiveness for COVID-19 vaccines currently authorized for use in Canada continues to evolve. For up to date information on vaccine efficacy and effectiveness, please consult the National Advisory Committee on Immunization (NACI) statements and publications on the [Health Canada webpage](https://www.canada.ca/en/health-canada/services/immunization/adviceанnd-studies.html).

## Who Should Delay Receiving the Vaccine

- Vaccination should be deferred in symptomatic individuals with confirmed or suspected SARS-CoV-2 infection, those with an acute illness, or those with symptoms of COVID-19 in order to avoid attributing any complications.
resulting from infection with SARS-CoV-2 or other illnesses to vaccine-related adverse events and to minimize the risk of COVID-19 transmission at an immunization clinic/venue. It would be prudent to wait for all symptoms of an acute illness to completely resolve before receiving the vaccine.

- Symptomatic and asymptomatic individuals who have been advised to self-isolate due to suspected or confirmed COVID-19 infection or due to close contact with a COVID-19 positive case should not attend a vaccine clinic and should wait to get their vaccine until their isolation period is over.
  - Note: Please refer to Guidance for COVID-19 Immunization in Long-Term Care Homes and Retirement Homes for specific guidance on vaccinating high risk contacts, those with symptoms or confirmed SARS-CoV-2 infection, in long-term care and retirement homes.

- Individuals who have recently received another vaccine within the past 14 days.
- Individuals who intend to receive a vaccine within 4 weeks of receiving the COVID-19 vaccine.
  - Anyone who receives a dose of a COVID-19 vaccine should wait 28 days before receiving another vaccine (except in the case when another vaccine is required for post-exposure prophylaxis).

**Considerations for other patient groups**

- The Moderna COVID-19 vaccine can safely be given to persons with evidence of a prior SARS-CoV-2 infection. Vaccination should be offered to persons regardless of history of prior symptomatic or asymptomatic SARS-CoV-2 infection.
  - Having prolonged COVID–19 symptoms (sometimes called Long COVID or Post-Acute COVID-19 Syndrome) is not a contraindication to receiving the COVID-19 vaccine.
  - If the patient is seriously debilitated, still under active investigation, or has evidence of recent deterioration, deferral of vaccination may be considered to avoid incorrect attribution of any change in the person’s underlying condition to the vaccine. Common side effects of the vaccine (e.g., fatigue, myalgia, arthralgia) may be similar to ongoing prolonged COVID-19 symptoms.
Information on immunizing special populations, including individuals who are breastfeeding or pregnant, individuals with allergies, individuals with autoimmune conditions, or individuals who are immunocompromised due to disease or treatment, is available in the Vaccination Recommendations for Special Populations guidance document. Point of care guidance for these individuals can be found in the COVID-19 Vaccine – Pre-Screening Assessment Tool for Health Care Providers.

**Precautions during vaccination should be taken for:**

- Refer to Vaccination Recommendations for Special Populations for information on vaccination for all patients with allergies (including those with allergic reactions to previous doses of any COVID-19 vaccine, or vaccine components).
  - The components of the Moderna vaccine that may cause type I hypersensitivity reactions include polyethylene glycol (PEG) and tromethamine (trometamol or Tris). Due to potential cross-reactivity with PEG, allergies to polysorbate must also be considered.
    - Allergic reactions to PEG are rare. PEG is found in products such as prescription medications, bowel preparation products for colonoscopy, over the counter products (e.g. laxatives, cough syrups), cosmetics, dermal fillers, skin care products, products such as ultrasound gel, and contact lens care solution. PEG also can be found in foods or drinks but is not known to cause allergic reactions from foods or drinks.
    - Tromethamine (trometamol or Tris) can rarely cause allergic reactions and is found in products such as contrast media, oral and parenteral medications.
    - Allergic reactions to polysorbate are rare. Polysorbate can be found in products such as medical preparations (such as vitamin oils, tablets, and anticancer agents) or cosmetics among others.
- Individuals who fainted or became dizzy after receiving a vaccine or medical procedure, or those with high levels of fear about injections can receive the vaccine. To reduce injuries due to fainting, they should be immunized while
seated, or if considered at high-risk, while lying down. These individuals are also advised they may bring a support person.

- Individuals who have a bleeding disorder, bruise easily or are taking blood-thinners can safely receive the vaccine. Individuals taking long-term anticoagulation (e.g. warfarin or heparin therapy) are not considered to be at higher risk of bleeding complications following immunization and may be safely immunized through the intramuscular route as recommended, without discontinuation of their anticoagulation therapy. In individuals with bleeding disorders, the condition should be optimally managed prior to immunization to minimize the risk of bleeding.
  - There is some evidence to suggest that IM administration with a small gauge needle (23 gauge or smaller) may be preferred to minimize the risk of bleeding, with firm pressure applied to the injection site for 5 to 10 minutes.

- For more detailed recommendations on people with allergies, as well as breastfeeding or pregnant individuals, individuals with autoimmune conditions, or individuals who are immunocompromised due to disease or treatment, please consult the Vaccination Recommendations for Special Populations guidance document.

**Side effects**

The Moderna COVID-19 vaccine, like medicines and other vaccines can cause side effects. In clinical trials most of the side effects experienced were mild to moderate and on average did not last longer than three days. Please see the product monograph for a complete list of reported side effects.
| Very common side effects | May affect more than 1 in 10 people | • Pain at injection site  
• Lymphadenopathy/ Axillary swelling and tenderness (enlarged lymph nodes)  
• Fatigue  
• Headache  
• Joint pain  
• Muscle pain |
|---|---|---|
| Common side effects | May affect 1 to less than 10 in 100 people | • Localized redness and swelling at injection site (very common after second dose)  
• Chills (very common after second dose)  
• Nausea and/or vomiting (very common after second dose) |
| Uncommon side effects | May affect up to 1 in 100 people | • Fever (very common after second dose) |

Source: National Advisory Committee on Immunization, Appendix E: Frequency of solicited adverse events following immunization for COVID-19 vaccines in clinical trials.

- There have been international reports of myocarditis (inflammation of the heart muscle) and pericarditis (inflammation of the lining around the heart) following vaccination with COVID-19 mRNA vaccines, including the Moderna vaccine. Available information indicates that cases have been mild, occurring more commonly after the second dose of vaccine and more often in male adolescents and young adults. Symptoms have been reported to start within several days after vaccination. This situation is being monitored closely in Canada and internationally. Based on reports received to date, the Public Health Agency of Canada (PHAC) and Health Canada are not seeing higher rates than would normally be expected in the population. To date, no clear causal association has been established between myocarditis/pericarditis and mRNA vaccines. mRNA COVID-19 vaccines continue to be recommended in all eligible individuals in Canada and in other countries where these mRNA vaccines are being used. For more information consult Public Health Ontario’s [Myocarditis and Pericarditis Following COVID-19 mRNA Vaccines](https://www.publichealthontario.ca/en/professional-development/myocarditis-pericarditis-following-covid-19-mrna-vaccines) resource and the [Myocarditis/Pericarditis FAQ resource for Health Care Providers](https://www.sickkids.ca/myocarditis/pericarditis-faq-resource-for-health-care-providers) resource from SickKids.
Adverse Events Following Immunization

All health care providers administering vaccines must be familiar with the anaphylaxis protocols for their clinic sites and ensure availability of anaphylaxis management kits (refer to the Public Health Ontario resource on the Management of Anaphylaxis Following Immunization in the Community and the Canadian Immunization Guide for additional information).

Those administering vaccines should ensure that the vaccine recipients or their parents/guardians are advised to notify clinic staff, or if they have left the clinic, call their doctor/nurse practitioner or go to the nearest hospital emergency department if they develop any of the following:

- Hives
- Swelling of the mouth and throat
- Trouble breathing, hoarseness or wheezing
- High fever (over 40°C or 104°F)
- Convulsions (seizures)
- Other serious reactions

Guidance on reporting adverse events following immunization (AEFI) for health care providers

- Health care providers administering vaccines are required to inform vaccine recipients of the importance of immediately reporting adverse events following immunization to a physician or nurse in accordance with Section 38 of the Health Protection and Promotion Act (HPPA). Vaccine recipients may also contact their local public health unit to ask questions or to report an adverse event following immunization.
- Specified health care providers (e.g., physicians, nurses and pharmacists) are required under s.38 of the HPPA, to report adverse events following immunizations (AEFIs), to their local public health unit. Reports should be made using the Ontario AEFI Reporting Form.
- See Public Health Ontario’s vaccine safety webpage and Fact Sheet - Adverse Event Following Immunization Reporting For Health Care Providers In Ontario (publichealthontario.ca) for additional guidance.
The Ontario Ministry of Health in collaboration with Public Health Ontario monitors reports of AEFIs. This monitoring is done in collaboration with the Public Health Agency of Canada and Health Canada.

**Point-of-care Guidance**

- The Moderna COVID-19 vaccine is a two dose series. Individuals may not be optimally protected until up to 2 weeks after their second dose of vaccine. It is essential to complete the vaccine series to boost the initial immune response and because it is anticipated to provide protection in the longer term.
- Do not mix the Moderna COVID-19 vaccine with other vaccines/products in the same syringe.
- Moderna COVID-19 vaccine should not be given simultaneously with other live or inactivated vaccines (except in the case when another vaccine is required for post-exposure prophylaxis).
- The National Advisory Committee on Immunization (NACI) recommendations on the use of a different mRNA COVID-19 vaccine product to complete a COVID-19 vaccine series started with an mRNA COVID-19 vaccine is being followed in Ontario:
  - NACI recommends that, if readily available*, the same mRNA COVID-19 vaccine product should be offered for the subsequent dose in a vaccine series started with an mRNA COVID-19 vaccine.
  - However, when the same mRNA COVID-19 vaccine product is not readily available*, or is unknown, another mRNA COVID-19 vaccine product recommended for use in that age group can be considered and should be offered to complete the vaccine series.
  - The previous dose should be counted, and the series need not be restarted.
  - *readily available = easily available at the time of vaccination without delay or vaccine wastage
- In alignment with NACI recommendations, an mRNA COVID-19 vaccine product may be offered for the subsequent dose in a vaccine series started with an AstraZeneca/COVISHIELD COVID-19 vaccine. The previous dose should be counted, and the series need not be restarted. For more information on second doses for individuals who received a first dose of the
AstraZeneca/COVISHIELD COVID-19 vaccine please see the Health Care Provider Q & A document and COVID-19 Vaccine Information for Individuals who received a first dose of the AstraZeneca/COVISHIELD COVID-19 vaccine.

- When a different vaccine product is used to complete the vaccine series, the earliest interval at which the vaccine can be given is the Health Canada product monograph authorized interval of the vaccine used for the first dose (i.e. 21 days where Pfizer-BioNTech is a first dose and 28 days where a Moderna COVID-19 vaccine is a first dose, and 4-12 weeks where AstraZeneca/COVISHIELD COVID-19 vaccine is a first dose). For current guidance on second dose eligibility and intervals, consult the COVID-19 Vaccine Series Second Dose Eligibility Quick Reference.

Vaccine Preparation:

Additional information on vaccine preparation and transport can be found in the product monograph and the COVID-19: Vaccine Storage and Handling Guidance.

- Thaw each vial before use:
  - Thaw in refrigerated conditions between 2°C to 8°C for 2 hours and 30 minutes. Alternatively, vials can be thawed at room temperature between +15°C to +25°C for 1 hour. Let each vial stand at room temperature for 15 minutes before administering.
  - Do not re-freeze vials after thawing.

- Swirl the vial gently after thawing and between each withdrawal. Do not shake.

- The vaccine is authorized as a 10-dose vial.
  - Canada may receive product that is labelled for the US market. Please read the vial label carefully prior to administration to determine the number of doses available per vial.

- For guidance on what to do when there is leftover solution in the vial or if more than 10 doses can be obtained, please see the Vaccine Storage and Handling Guidance document.

Vaccine Administration:

- Moderna COVID-19 vaccine is a white to off-white suspension. It may contain white or translucent product-related particulates. Inspect Moderna COVID-19 Vaccine vials visually for foreign particulate matter and/or discoloration prior
to administration. If either of these conditions exists, the vaccine should not be administered.

- Moderna COVID-19 Vaccine should be administered by the intramuscular (IM) route only. Do not inject the vaccine intravascularly, subcutaneously or intradermally. The preferred site is the deltoid muscle of the upper arm.
- It is important that proper sized syringes are chosen to ensure the correct volume is accurately drawn up. Safety engineered needles must be used as required under O. Reg. 474/07 made under the Occupational Health and Safety Act.
- Refer to the Canadian Immunization Guide, Table 3: Needle selection guidelines for assistance in selecting appropriate needle length and gauge.
- Using aseptic technique, cleanse the vial stopper with a single-use antiseptic swab.
- Withdraw each 0.5 mL dose of vaccine from the vial using a new sterile needle and syringe for each injection. Pierce the stopper preferably at a different site each time. The dose in the syringe should be used as soon as feasible and no later than 24 hours after the vial was first entered (needle-punctured).
- Moderna COVID-19 vaccine is preservative free. Once the vial has been entered (needle-punctured), it should be discarded after 24 hours. Do not refreeze. Thawed vials and filled syringes can be handled in room light conditions. Any non viable vaccine or waste material should be disposed of in accordance with local requirements.

All clients should be reminded to continue to practice recommended public health measures for prevention and control of COVID-19 infection and transmission regardless of receipt of COVID-19 vaccine.

Information on vaccine storage, stability and disposal can be found in the Vaccine Storage and Handling Guidance document.
